

# Oaks/Grass Savanna AmeriFlux Site in California

Dennis Baldocchi

Siyan Ma and Joe Verfaillie

University of California, Berkeley

ECOSTRESS Meeting, UC Davis, May 16, 2017

# Objectives

- Give Overview of Resources and Metadata
- Report on findings from 16+ years of continuous carbon, water and energy fluxes measured over Oak savanna and annual grassland

## Tonzi Ranch, US-Ton, AmeriFlux Tower

# Oak Savanna is Perfect Laboratory for Studying Ecosystem-Climate Interactions

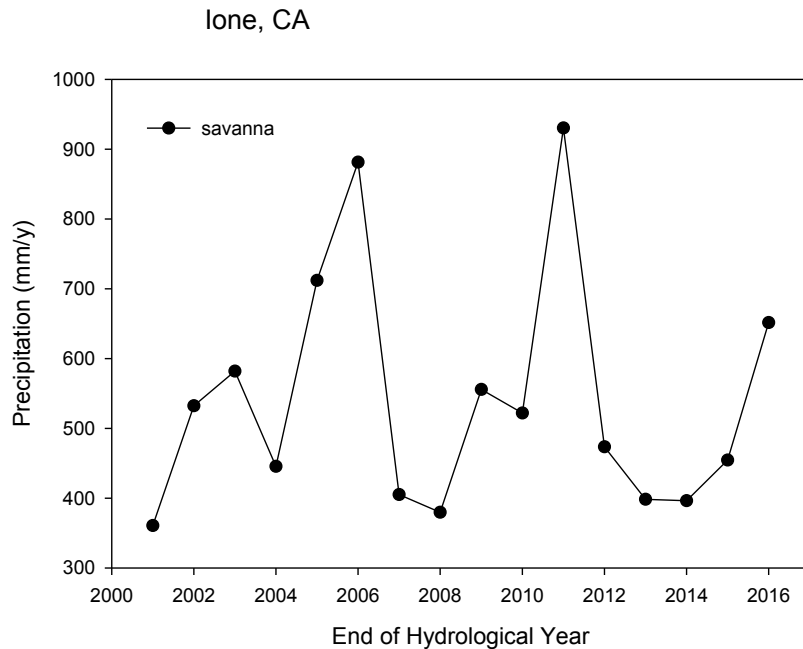

Distinct Wet and Dry Periods, to Study Effects of Varying Soil Moisture on Carbon and Water Exchange

Experiences wide range of Temperature (0-40 C), to study effects of Warming on Ecosystem Processes

Experiences wide range of Annual Precipitation (300-1000 mm), to study non-linear effects of rainfall on ecosystem metabolism

Open Structure Challenges assumptions of Simple Big-Leaf Models

## Interannual Variability of Rain at Tonzi/Vaira Ranches

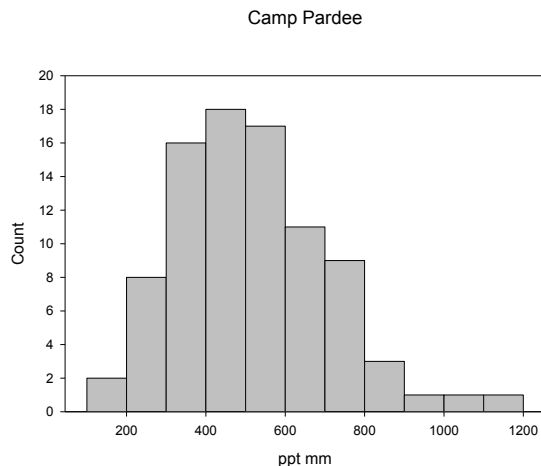

We've Experienced Average and Extremely Wet and Dry Years over the past 16 years

2012/13 were dry but we experienced Dry years before

Oaks are adapted to dry years and can survive 2 dry years in a row.

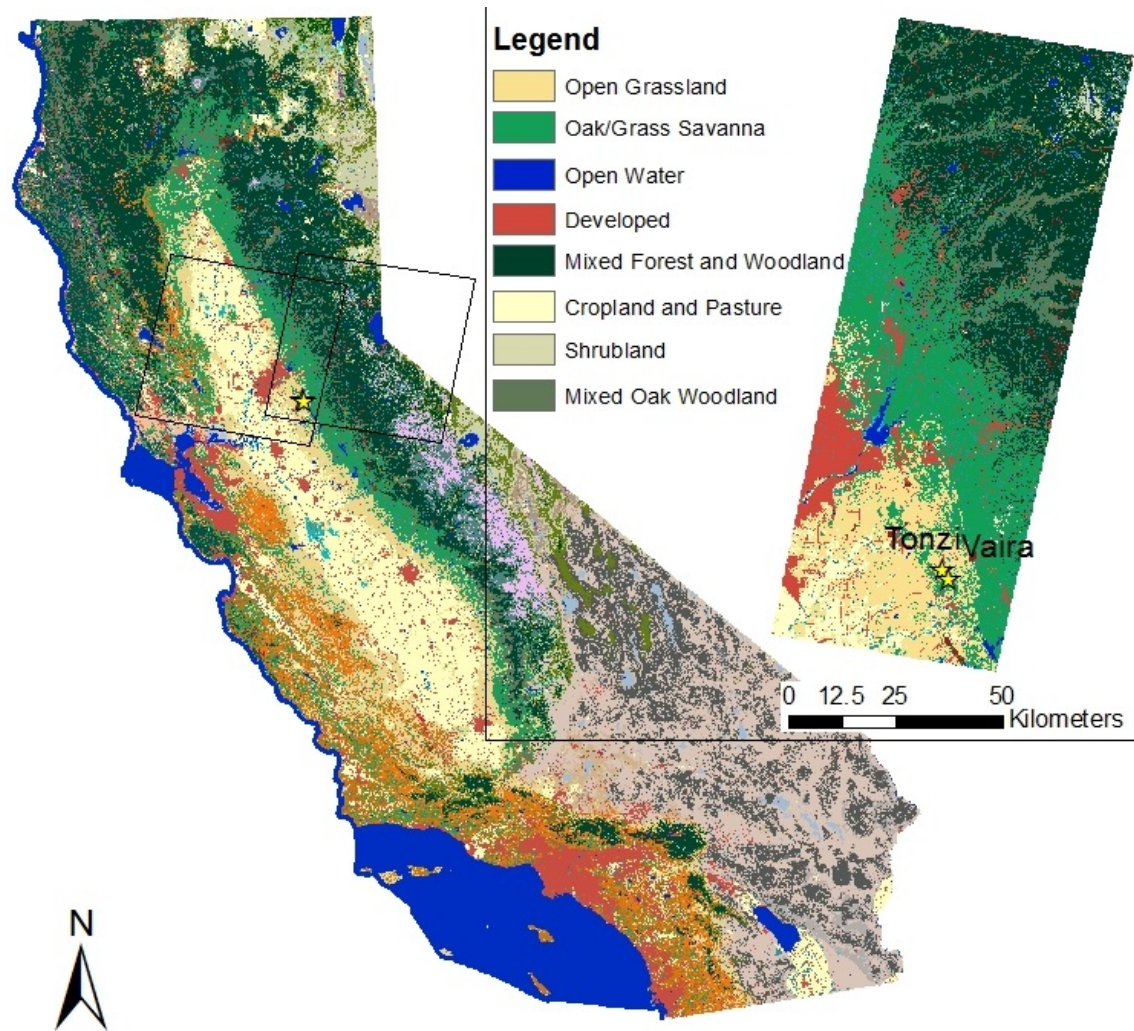

What about 3 dry years in a row?  
They tend to occur rarely.

Griffin + Anchukatis, 2015 GRL

Liu, Y., M. J. Hill, X. Zhang, Z. Wang, A. D. Richardson, K. Hufkens, G. Filippa, D. D. Baldocchi, S. Ma, J. Verfaillie, and C. B. Schaaf. 2017. Using data from Landsat, MODIS, VIIRS and PhenoCams to monitor the phenology of California oak/grass savanna and open grassland across spatial scales. *Agricultural and Forest Meteorology* **237**–**238**:311-325.

# Modis Operandi

- Direct Carbon, Water and Energy Flux Measurements with Eddy Covariance
- Spatial Upscaling with Remote Sensing
  - Terrestrial and Airborne LIDAR, IKONOS (1-4 m resolution)
- Temporal Upscaling with Digital Cameras and Veg Indices
  - Phenology and Dynamics of Leaf Area Index
- Mechanistic Understanding of Ecophysiological Processes
  - Understory eddy flux system and soil CO<sub>2</sub> probes for flux partitioning
  - Ecosystem Modeling, CANOAK-3D
  - Physiological Measurements of Pre-Dawn Water potential and photosynthetic capacity, TRY
  - Soil moisture networks, COSMOS, SMAP, ISMN
  - Root and Soil Depth, with GPR

# Eddy Flux Instrumentation

3d Sonic Anemometer

Non Dispersive Infrared Gas  
Spectrometer for CO<sub>2</sub> and H<sub>2</sub>O

# Eddy Covariance

$$F = \overline{w'c'}$$

# Repository of Remote Sensing Data

- Ikonos: 07/22/2001
- Avris: 2005, 2006, 2009
- CASI:
- Airborne LIDAR: 2003, 2009
- Terrestrial Lidar: 2014
- MODIS Time Series...
- Upward Looking Digital Camera time series: 2006-
- LED/NDVI time series: 2006->
- High Resolution spectral reflectance time series (2006-)
- Understory Tram System (PAR and Rn in x): 2006-2015
- Tower-based Digital Web Camera: 2005->

## Tonzi Ranch Oak Savanna, near Lone

IKONOS

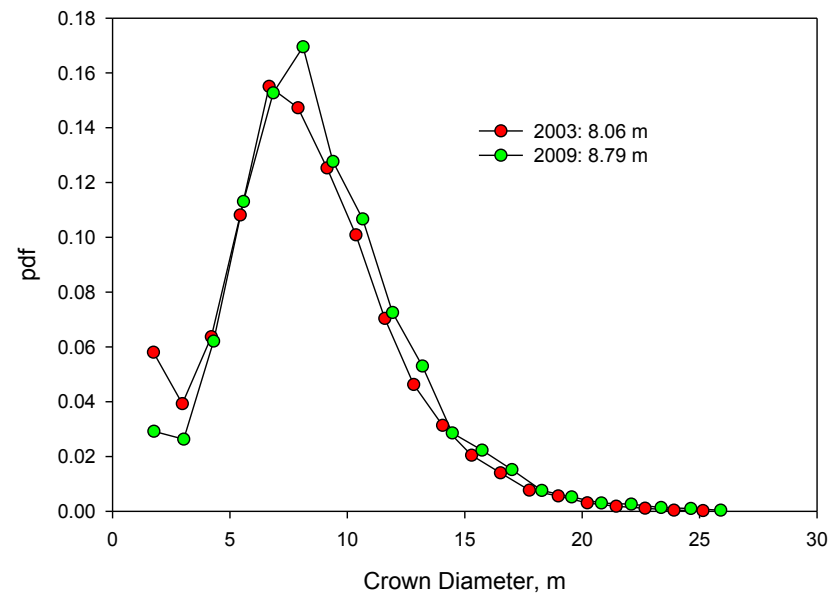

## Canopy Structure: Laser Altimeter Data

LIDAR Measurements of Tree Height  
Oak Savanna, lone, CA

LIDAR, Oak Savanna, lone, CA

# Monitor Surface Phenology with a Suite of Optical Sensors

LED NDVI Sensor

Flux Tower with Digital Camera

Hyper-spectral spectrometer

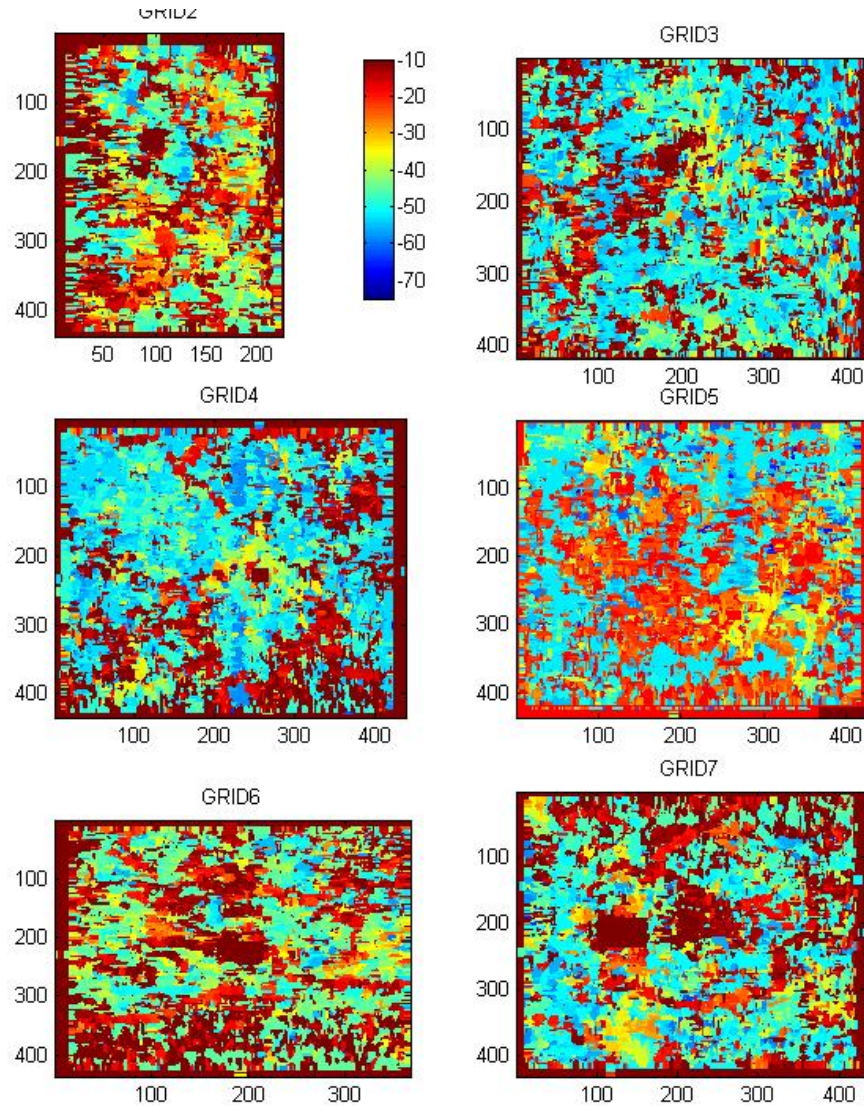

Upward Looking Camera

# Gap Fraction Phenology with Upward Looking Cameras under Oak Savanna

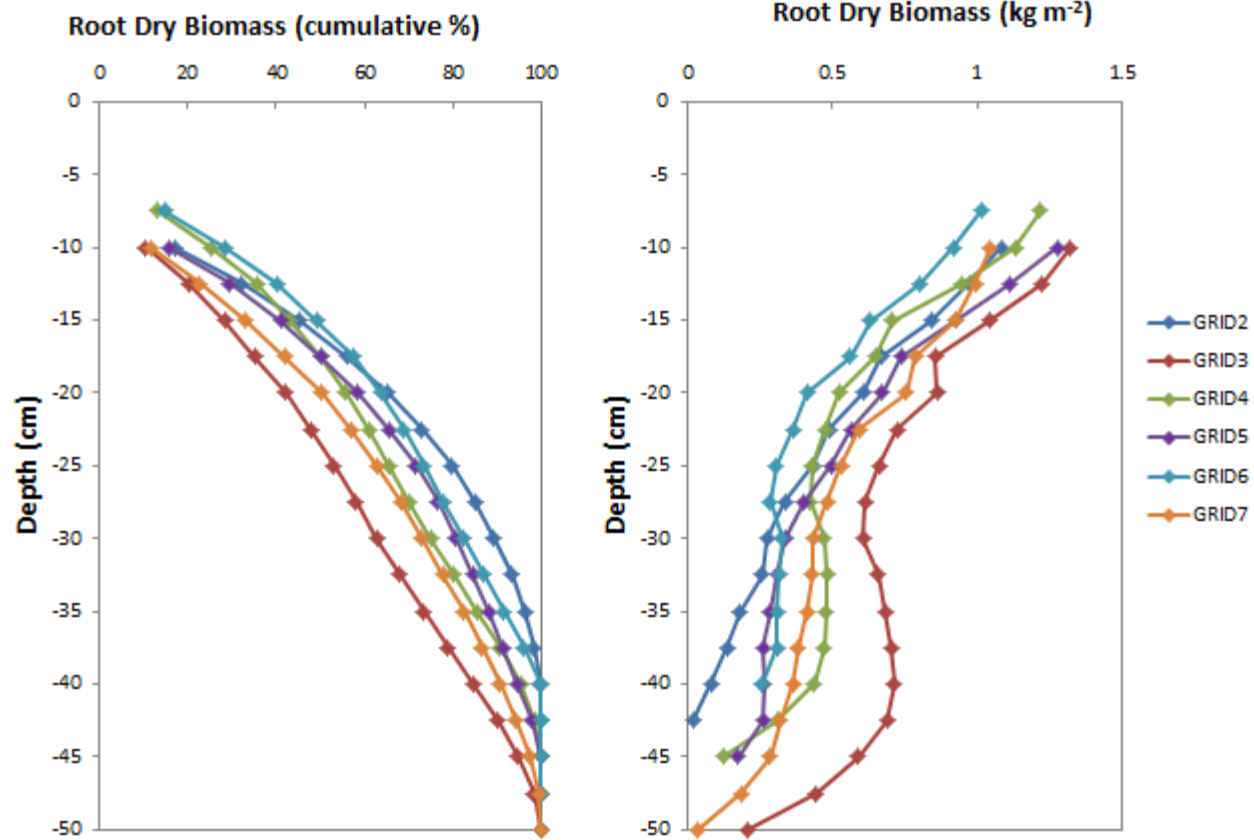

Can Detect Start and End of Growing Season with Precision

# Soil Depth with Ground Penetrating Radar

# Roots!

# Seasonality of Soil Moisture

Oak Savanna 2005

## Monitoring Depth to Ground Water

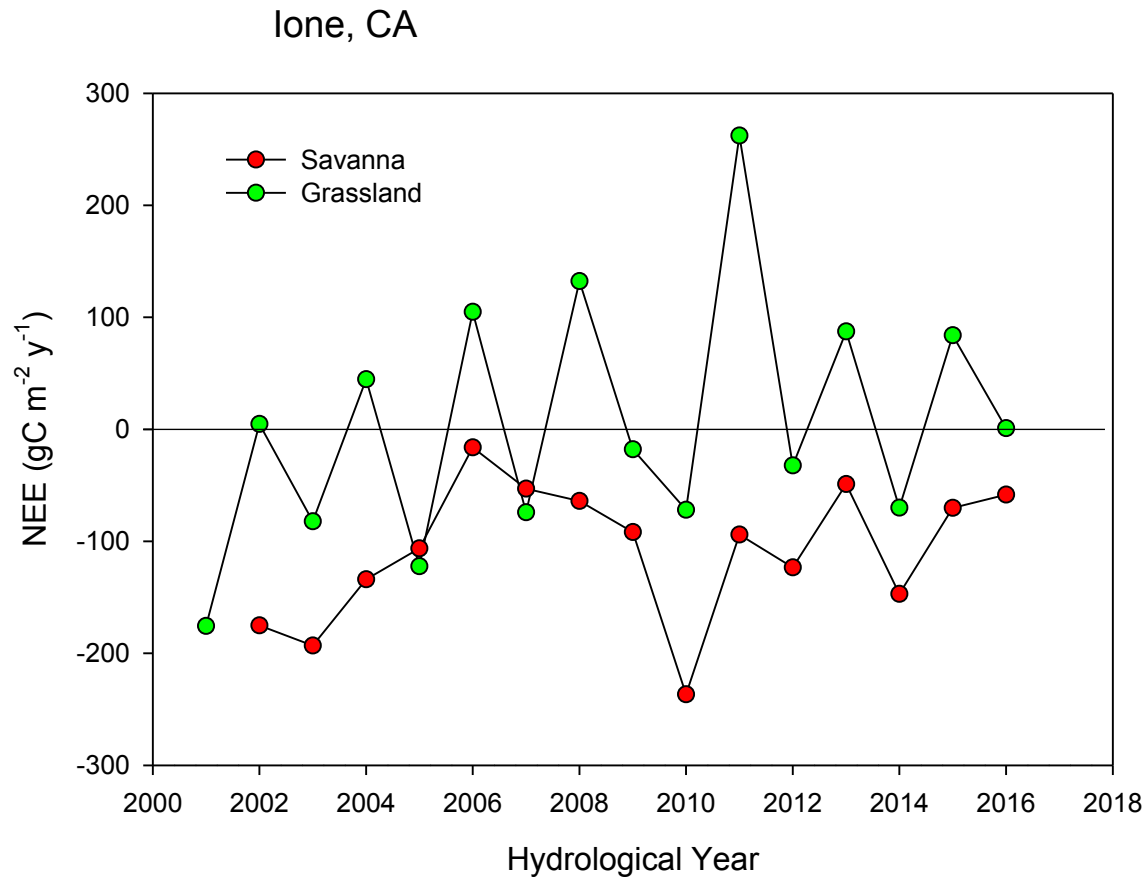

Ma et al. 2016 AgForMet  
Miller et al, 2010, WRR

## Seasonality of Photosynthetic Capacity

# Interannual Variability of Net Ecosystem Carbon Exchange

Tonzi Ranch

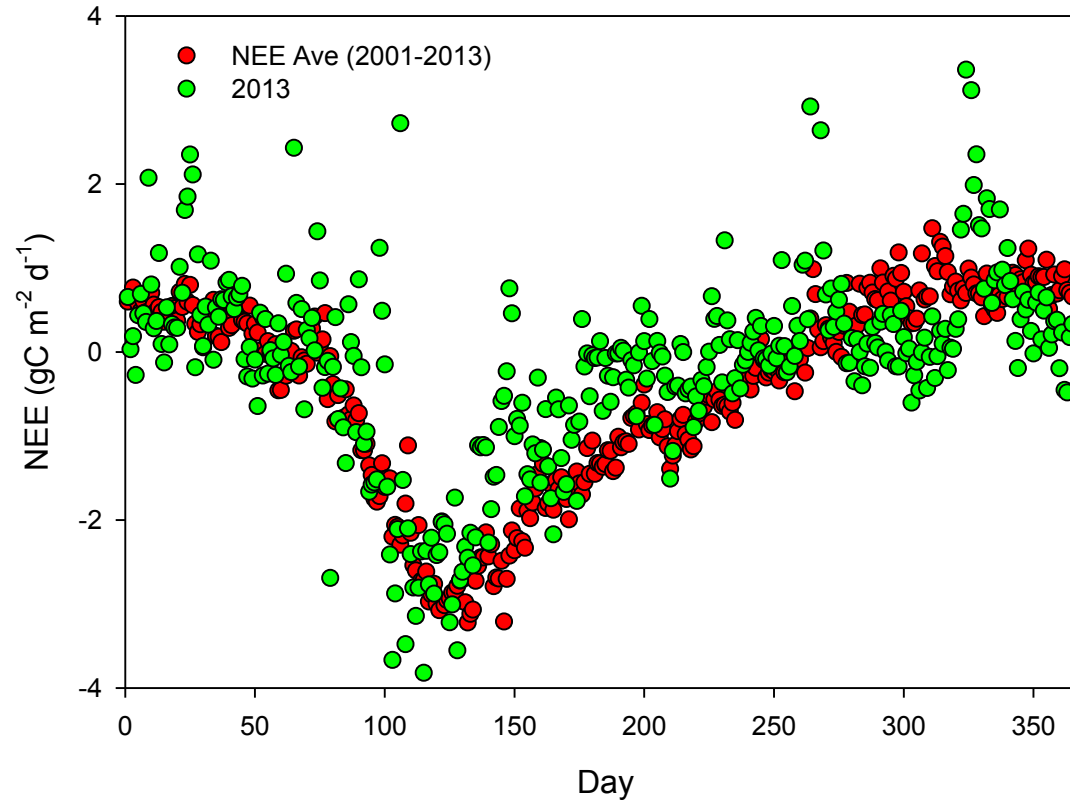

Vaira Ranch

Grassland is Carbon Neutral, a slight source:  $27 \text{ gC m}^{-2} \text{y}^{-1}$   
Savanna is a modest Sink,  $-157 \text{ gC m}^{-2} \text{y}^{-1}$

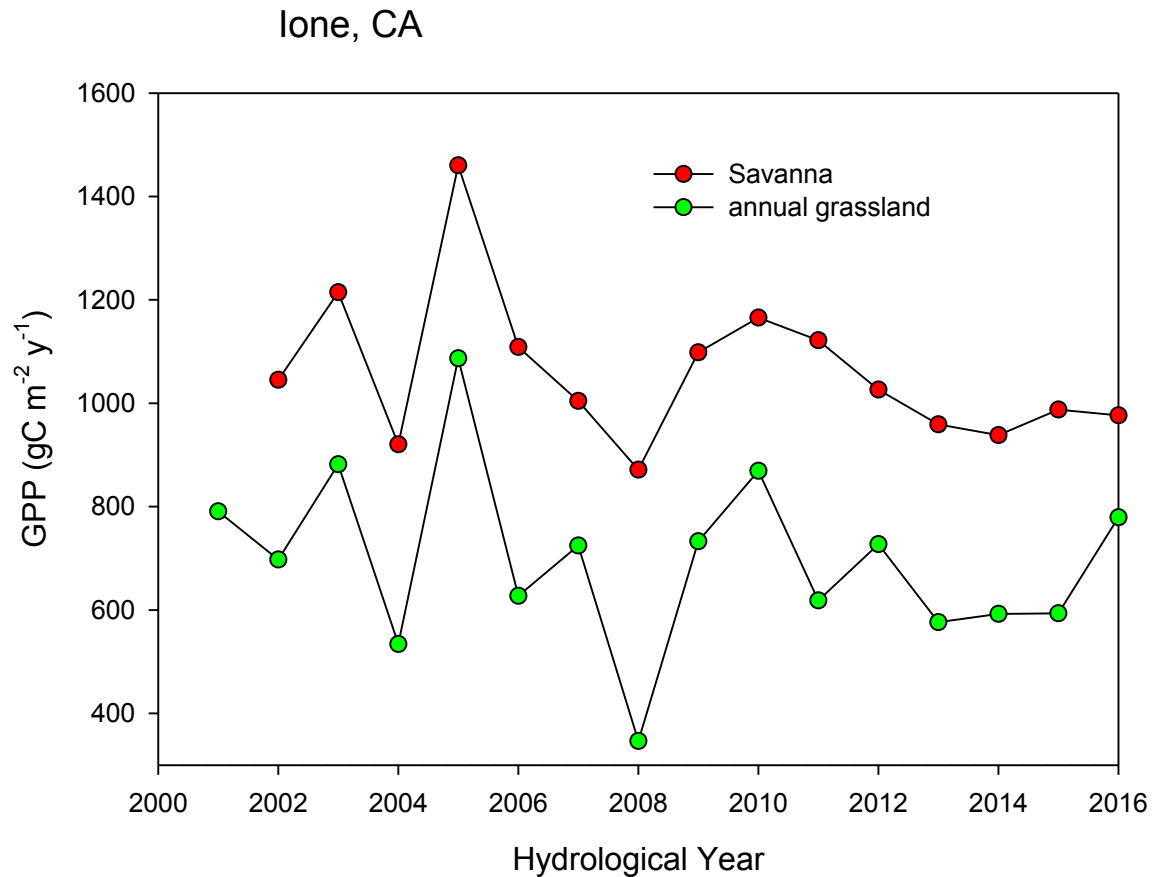

# Effect of Drought

## Savanna

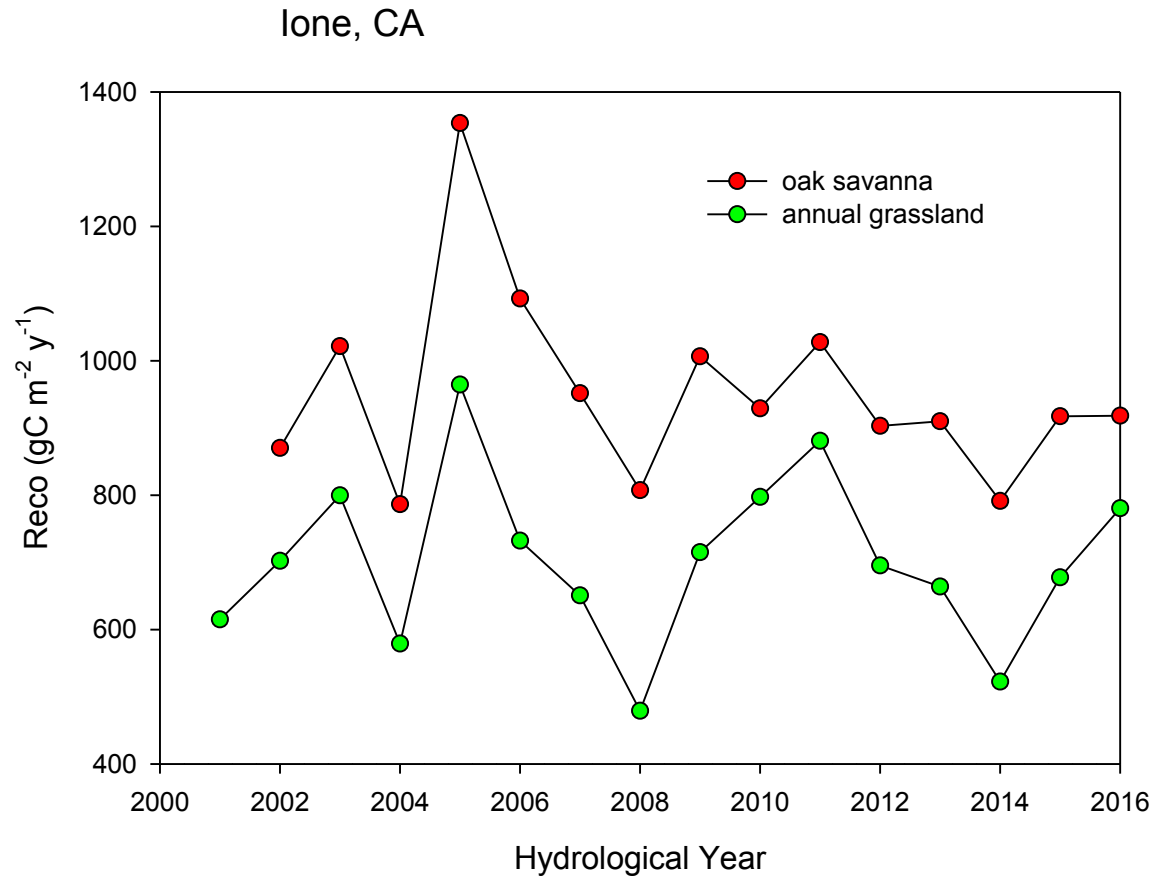

2013 was Normal until about D120, then System shut down, Physiologically

# Variation in Gross Primary Productivity

Savanna ( $1060 \text{ gC m}^{-2} \text{y}^{-1}$ ) was more productive, by 40%,  
than the Grassland ( $665 \text{ gC m}^{-2} \text{y}^{-1}$ )

# Variation in Ecosystem Respiration

The 'cost' of a more Productive System

# Rain and Evaporation

Savanna ET:  $404 \pm 64 \text{ mm y}^{-1}$   
Annual Grass ET:  $323 \pm 26 \text{ mm y}^{-1}$   
ppt:  $542 \pm 173 \text{ mm y}^{-1}$

lone, CA

# On-Going Work

Work Continues at part of AmeriFlux and FLUXNET networks

Use Terrestrial Lidar to Characterize Canopy and Apply 3-d Models to Simulate Light, carbon and Water Exchange

Collaborating with COSMOS and SMAP projects To detect soil moisture dynamics with remote Sensing and microwave band radar

Data are Widely Used in Validating Models, Remote Sensing Products and Cross Site Syntheses

# Life as a Blue Oak: Fitting through the Evolutionary Eye of the Needle

Photosynthesis  
> Respiration

Photosynthesis Scales with  
Evaporation

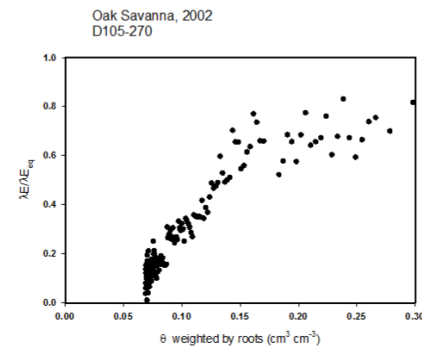

Photosynthesis is Inhibited  
during the Summer Growing  
Season due to Soil Moisture  
Deficits

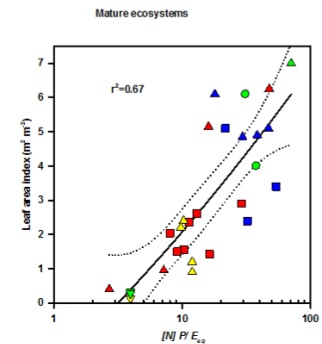

Evaporation < Precipitation

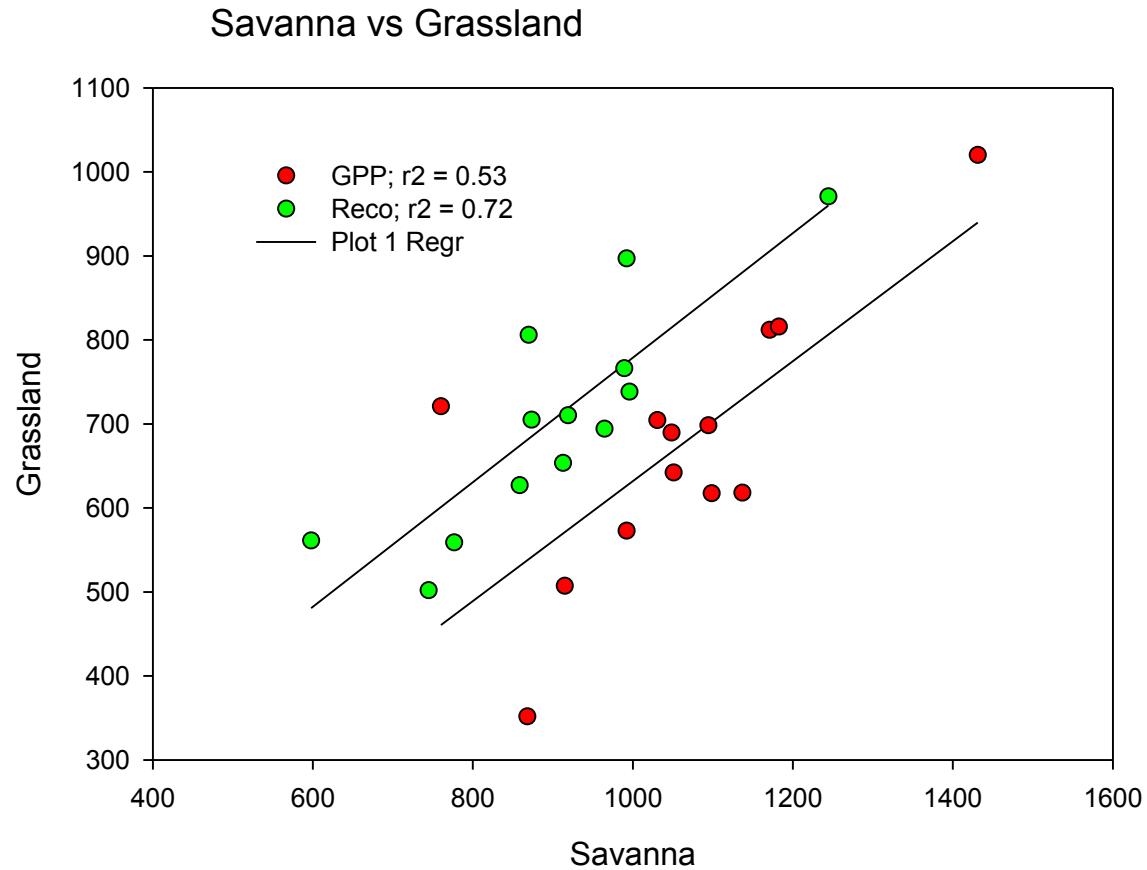

Reductions in Soil Moisture Induces  
Stomatal Closure, which Deficits Down-  
Regulates Evaporation...and Photosynthesis

Water Budget Constrains Leaf  
Area Index that is Sustained

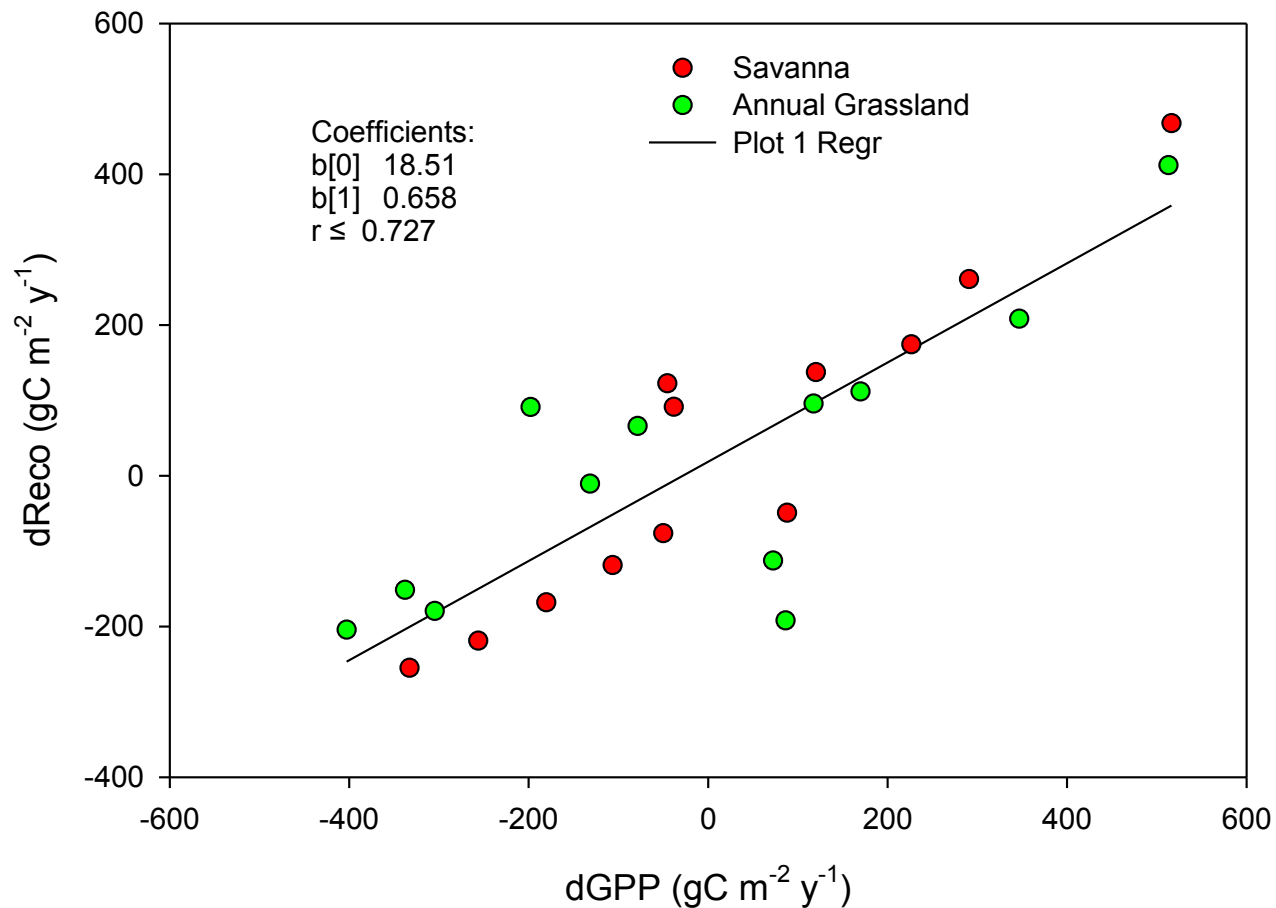

# Carbon Fluxes at the Savanna and Grassland are in Synchrony

Years that Promote Productivity, relative to the Prior year  
Come at the Cost of More Respiration,  
And Vice Versa

Year to Year Changes in Productivity

# Climate Trends: Pardee, CA

Temperature Increased by about 1.25 C over 60 Years

Precipitation is Highly Variable and Near the Borderline to Sustain Forests vs Grass

Camp Pardee

Camp Pardee
